

Concept: absorption in small intestines

How it is done: Insides are made of folds->villus ->villi->microvilli: increases surface area for absorption

Drawing

Poem: haiku

Small intestine

Food particles nom nom

Absorb in villus

Effectiveness: Now, considering the effectiveness of both the drawing and poem must be done with a grain of salt, maybe an ocean amount. Initially I will take a drawing/diagram over anything as a way to help with understanding a concept. So as a personal taste, I will state that the drawing is better at conveying information than the poem. However, if a better poem was written than a simple haiku, maybe it would be better with memorization information quickly. I like diagrams better because they are able to show a process and it makes it easier to label things.
